

Say Good-Bye to Unhygienic Conditions

Microbiologist **Dr. Charles Gerba** has studied washroom **contamination** for over 20 years

According to Dr. Gerba the **No.1 bacterial hot spot** in the washroom is the **sanitary napkin disposal unit**

Users and cleaning staff are exposed to **bloodborne pathogens like Hepatitis** and harmful microorganisms like E. coli, Cryptosporidium, Staphylococcus, & Salmonella, and C. difficile unless units are **sanitized regularly**

Not to mention, **COVID-19 can last up to 72 hours on stainless steel**, risking surface-to-person transmission of the virus.

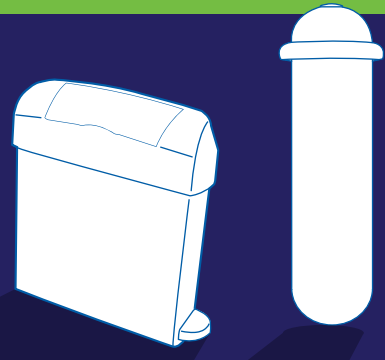

Worldwide, about **350 million people** have **Hepatitis B**

Hep B virus can live outside of the body **for 7 days**

It is safer to assume all items containing **blood also harbor bloodborne pathogens**

By installing a dedicated, enclosed disposal unit from **Citron Hygiene™** we can **mitigate any potential risk to your customers or workers**

Citron Hygiene's technicians **maintain and sanitize** each system on a pre-determined schedule **inside and out.**

In 2020 it is unacceptable to not have a safe or effective method for disposing of personal hygiene waste.
